Periodontics - Dental Postgraduate Program

Overview

The objective of the Periodontics Dental Postgraduate Program is to set a standard of excellence. We accomplish this by offering an in-depth experience in the realm of periodontology and periodontics. The program involves both clinical and didactic training, including seminars, lectures, hands-on demonstrations, and treatment of patients. Specialized areas of periodontics, such as implants, IV sedation, and research are explored. Basic and advanced surgical methods (e.g., traditional periodontal surgery, soft tissue grafts, sinus augmentation, guided bone augmentation and onlay graft) are all available as part of the program.
